

# Helpful Tips To Keeping A Healthy Curtain Track

## CHECK YOUR ROLLERS CARRIERS:

Older roller carriers can break down, which creates drag and friction when moving along the track. Replace older roller carriers with ones specific for your brand of track. If you are unable to source your own roller carriers, we can provide you with universal roller carriers.

## CLEAN THE TRACK:

Over time, dust and gunk can build up in the track. This stops the roller carriers from rolling and gliding smoothly. Make sure to clean your cubicle curtain track on a regular basis.

## APPLY SILICONE SPRAY:

Treating the track with silicone spray can help lubricate the roller carriers and prevent any resistance when moving the curtain along the track.

## IS YOUR TRACK PROPERLY INSTALLED?

To meet typical code requirements, your track needs to attach to structure at least every 2' on center and have proper blocking behind the ceiling. Anywhere the track curves also needs to be connected to structure as this is a weak point in the track run. Lastly, make sure that the end points of the track are installed correctly. These are areas that are often missed.

## CHECK YOUR SPLICES:

Track splices can come apart over time. This causes a gap that can disrupt the roller carrier from moving effortlessly along the track. Make sure that these splices are tightened up and that roller carriers can easily clear the screws.

## ROLLERS BREAKING OR POPPING OUT OF THE TRACK?

Usually this is a symptom of having to pull too hard to move the curtain around the track. Complete the steps above to eliminate added stress to your curtain track and roller carriers.
